

Scania Display Manual

SCANIA

When the EMS control unit or the coordinator detects a fault, the diagnostics lamp on the instrument panel/s comes on, and it stays on as long as the fault is active. At the same time, a fault code is generated which can be read off via the coordinator on the diagnostics lamp in the form of a flashing code when the diagnostic switch is activated. A flashing code may consist of a number of different fault codes.

Diagnosis and troubleshooting with *Scania EMS Display* is described in the *Operator's Manual for Scania Instrumentation*.

If the torque reducing function is activated, the fuel amount and the engine power output are reduced to 70%, and if the engine shutoff function is activated, the engine is shut off at programmed alarm levels.

A separate PC-based diagnostics program is used to read off the contents of the flashing codes. For in-depth analysis of fault codes, contact an authorised Scania dealer.

Reading off the fault codes, and descriptions of these, are also covered in a separate document in the workshop manual, *Engine Management System EMS-S6: Troubleshooting*.

Only authorised personnel are allowed to carry out diagnostic procedures and program changes.

The positions of the sensors which emit signals to the control unit are shown in the illustrations on page 18.

See pages 20 and 22 for a description of how to read off flashing codes.

See pages 21 and 23 for a list of flashing codes for the control unit and coordinator.
